

Re-analysis Summary Report for Peer-evaluation

Paper ID: Anderson_AmEcoJourn_2011_bLe8

Re-analyst's ID: 12hio

Your task

As a peer-evaluator, for this paper you are asked to judge whether the analyst's applied analytical choices for Task 1 and Task 2 are acceptable. By acceptable, we mean that the analysis pipeline is within the variations that could be considered appropriate by the scientific community in addressing the given analytical task. In addition, for Task 1, we ask you to judge whether the reported conclusion adequately follows from the results of the analysis; whether the co-analyst's self-categorization of the result is adequate. Although, you are not required, it would be appreciated, if you could execute the accompanying analysis code to check any mismatch between the results of the analysis and the reported results.

For both tasks, you should provide your evaluation via this survey: <https://forms.gle/EAREaC6JjN2PWFfR6>

The re-analyst's task

The re-analyst was instructed to assess the following claim of the original authors:

... [the study] finds substantially higher income for low-caste households residing in villages dominated by BACs [compared to villages dominated by upper caste]. (p. 240.)

The corresponding article

Here you can find the original article: https://osf.io/hcxdq/files/osfstorage/5e56aac535d22d02f75f482c?view_only=32ccf80d2c684ea9ac10ebbc4ec34df6

and the original data: https://osf.io/k7xzy/?view_only=c1f2b9aaf05d486c942783efd8ec57ec

They are provided only as context of the re-analysis.

In Task 1, the analyst was asked to conduct the analysis without any restrictions. Here, the analyst reported the following steps and results of the analysis:

The data were given in an easy-to use table, which included a number of demographic variables. The claim of the author's was a simple one: that the income difference between two types of households (upper and lower caste) was significantly different, and, specifically, that income was substantially higher in low-caste households. To test this claim, a t-test was conducted which compared the income for these two household types. The data showed that the difference between the two households was significant, $p < .001$, and that the reporting in the original manuscript was accurate.

The analyst's conclusion: In this sample, low-caste households had a significantly higher income than upper-caste households.

The analyst's categorization of the result:

The results show evidence for the relationship/effect as described in the claim provided in your task

In Task 2, the analysts received the following instruction to conduct the analysis:

You should not use District controls, Crop controls, Distance controls, Groundwater controls, Public goods controls Do not include Irrigation, credit, and tenancy variables, and their interaction term versions Do not use instruments for water buyer status.

Here, the analyst reported the following steps and results of the analysis:

The requirement was to compare incomes of lower and upper caste households. Thus, the raw values were subjected to a t-test to determine if any significant difference in households was present. This was indeed the case $t(1,295)=4.9$, $p < .001$

Analysis language/software/code (optional to check):

Task 1: STATA

Task 2: Stata
