

Re-analysis Summary Report for Peer-evaluation

Paper ID: Adida_CompPolitStu_2016_G0Kb

Re-analyst's ID: lpvn9

Your task

As a peer-evaluator, for this paper you are asked to judge whether the analyst's applied analytical choices for Task 1 and Task 2 are acceptable. By acceptable, we mean that the analysis pipeline is within the variations that could be considered appropriate by the scientific community in addressing the given analytical task. In addition, for Task 1, we ask you to judge whether the reported conclusion adequately follows from the results of the analysis; whether the co-analyst's self-categorization of the result is adequate. Although, you are not required, it would be appreciated, if you could execute the accompanying analysis code to check any mismatch between the results of the analysis and the reported results.

For both tasks, you should provide your evaluation via this survey: <https://forms.gle/EAREaC6JjN2PWfFR6>

The re-analyst's task

The re-analyst was instructed to assess the following claim of the original authors:

... priming the first lady's ethnicity increases support for President Yayi among her coethnics. (p. 635.)

The corresponding article

Here you can find the original article: https://osf.io/hcxdq/files/osfstorage/5e21e2a6675e0e009c6b4d01/?view_only=c874fcf097644e82a320679d4641163a

and the original data: https://osf.io/avj8y/?view_only=978a4c4cd219427c9f529a1128478dc7

They are provided only as context of the re-analysis.

In Task 1, the analyst was asked to conduct the analysis without any restrictions. Here, the analyst reported the following steps and results of the analysis:

Preprocessing: 1. I've selected respondents who were shown one of the three versions (control, mention of wife, mention of wife's ethnicity) of the president bio paragraph, and checked the distribution. 2. I've recoded respondents into three ethnic categories: wife's coethnics, president's coethnics, and non-ethnics and checked the variable distribution (note that the numbers do not match exactly the numbers provided in the text, but I couldn't find enough information to detect the source of this discrepancy).

Hypothesis: President's wife coethnics (but not respondents from other ethnicities) will be more likely to indicate their willingness to vote for the president after being primed with her ethnicity.

Analytical approach: I tested the hypothesis using logistic regression (given that the DV was dichotomous), with the experimental group (control, wife, wife's ethnicity) and respondent's ethnicity (wife's coethnic, president's coethnic, non ethnic) and their interaction as independent variables. For each ethnic group I then compared voting intentions in both experimental groups to the control group.

The analyst's conclusion: The hypothesis was supported. Wife's coethnics (but not president's coethnics

or non ethnics) primed with the wife's ethnicity were more likely to indicate they would vote for the president.

The analyst's categorization of the result:

The results show evidence for the relationship/effect as described in the claim provided in your task

In Task 2, the analysts received the following instruction to conduct the analysis:

You should restrict your analysis to Benin-related survey experiment data.

Here, the analyst reported the following steps and results of the analysis:

- I selected participants who were presented with one of the three experimental conditions. - I recoded participant ethnicity into three relevant groups: wife's coethnics, president's co-ethnics, non-ethnics. - I checked that the DV was a dichotomous variable and used logistic regression with experimental group, ethnicity, and the interaction of both. -I then ran contrasts with control group as a reference to test the main hypothesis

The main hypothesis I was testing was: Respondents who were the first lady's co-ethnics who were primed with her ethnicity were more likely to vote for President Ya'ay than her co-ethnics in the control condition (who weren't primed with her ethnicity).

Results of the analysis gave some support for the hypothesis (OR = 2.816, 95%CI [1.074, 7.38], however the effect was significant only at $p = .032$.

Analysis language/software/code (optional to check):

Task 1: R

Task 2: R
